see also geometric mechanics part i dynamics and symmetry 2nd edition this textbook introduces modern geometric mechanics to advanced undergraduates and beginning graduate students in mathematics physics and engineering in particular it explains the dynamics of rotating spinning and rolling rigid bodies from a geometric viewpoint by formulating their solutions as coadjoint motions generated by lie groups the only

prerequisites are linear algebra multivariable calculus and some familiarity with euler lagrange variational principles and canonical poisson brackets in classical mechanics at the beginning undergraduate level the book uses familiar concrete examples to explain variational calculus on tangent spaces of lie groups through these examples the student develops skills in performing computational manipulations starting from vectors and matrices working through the theory of quaternions to understand rotations then transferring these skills to the computation of more abstract adjoint and coadjoint motions lie poisson hamiltonian formulations momentum maps and finally dynamics with nonholonomic constraints the organisation of the first edition has been preserved in the second edition however the substance of the text has been rewritten throughout to improve the flow and to enrich the development of the material many worked examples of adjoint and coadjoint actions of lie groups on smooth manifolds have also been added and the enhanced coursework examples have been expanded the second edition is ideal for classroom use student projects and self study a

divided into four parts this book covers recent developments in topics pertaining to gravity theories including discussions on the presence of scalar fields part one is devoted to exact solutions in general relativity and is mainly concerned with the results of rotating null dust beams and fluids also included is a panoramic vision of new research directions in this area which would require revising certain theorems and their possible extensions within gravity theories new aspects concerning the ernst potentials double kerr spacetimes and rotating configurations in particular there is a detailed discussion of totally symmetric and totally geodesic spaces in which a method for generating 2 1 dimensional solutions from 3 1 dimensional solutions is given part two deals with alternative theories of gravity all of which include scalar fields and gauge fields here quantum and cosmological effects which arise from both gravity theories in four and higher dimensions and from metric affine theories are investigated part three is devoted to cosmological and inflationary scenarios local effects such as the influence

of scalar fields in protogalactic interactions numerical studies of the collapse of molecular cores as well as the inverse inflationary problem and the blue eigenvalue spectrum of it are considered moreover the role of scalar fields as dark matter and quantum cosmology in the bergman wagoner and gowdy theories together with the relation of the conformal symmetry and deflationary gas universe are likewise presented the last part of the book includes some mixed topics which are still in the experimental stage among them are the foundation of the maxwell theory a discussion on electromagnetic thirring problems a note on the staticity of black holes with non minimally coupled scalar fields and a study of the lorentz force free charged fluids in general relativity thus this book is the most up to date comprehensive collection of papers on the subject of exact solutions and scalar fields in gravity and is a valuable tool for researchers in the area
