this is the first book of a two volume textbook on real analysis both the volumes analysis i and analysis ii are intended for honors undergraduates who have already been exposed to calculus the emphasis is on rigor and foundations the material starts at the very beginning the construction of number systems and set theory analysis i chaps 1 5 then on to the basics of analysis such as limits series continuity differentiation and riemann integration analysis i chaps 6 11 on euclidean spaces and analysis ii chaps 1 3 on metric spaces through power series several variable calculus and fourier analysis analysis ii chaps 4 6 and finally to the lebesgue integral analysis ii chaps 7 8 there are appendices on

mathematical logic and the decimal system the entire text omitting some less central topics is in two quarters of twenty five to thirty lectures each

in elementary introductions to mathematical analysis the treatment of the logical and algebraic foundations of the subject is necessarily rather skeletal this book attempts to flesh out the bones of such treatment by providing an informal but systematic account of the foundations of mathematical analysis written at an elementary level this book is entirely self contained but as indicated above it will be of most use to university or college students who are taking or who have taken an introductory course in analysis such a course will not automatically cover all the material dealt with in this book and so particular care has been taken to present the material in a manner which makes it suitable for self study in a particular there are a large number of examples and exercises and where necessary hints to the solutions are provided this style of presentation of course will also make the book useful for those studying the subject independently of taught course

the first volume of three providing a full and detailed account of undergraduate mathematical analysis
